Sprint 04

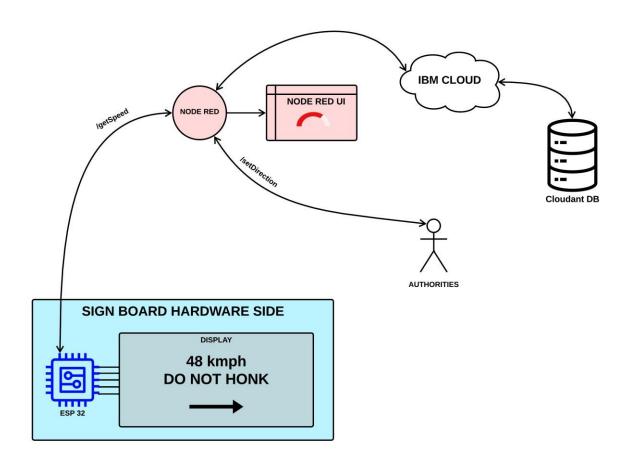

Signs with Smart Connectivity for Better Road Safety

Team ID - PNT2022TMID10531

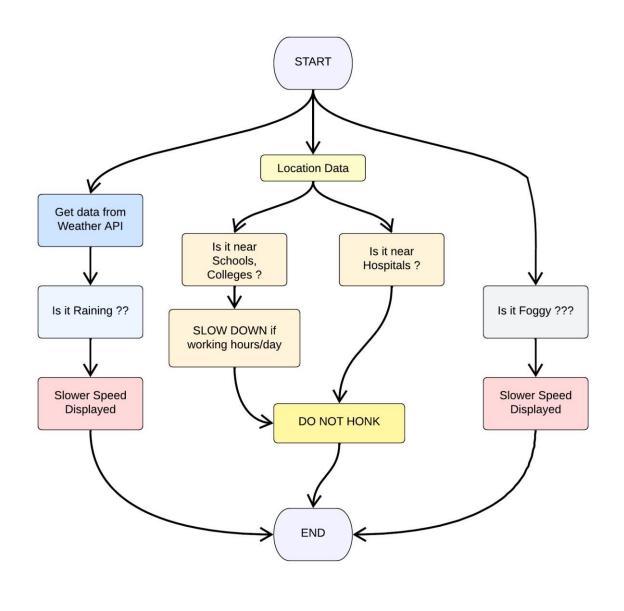

Sprint Goals:

1. Hardware & Cloud integration **Process**

Flow:

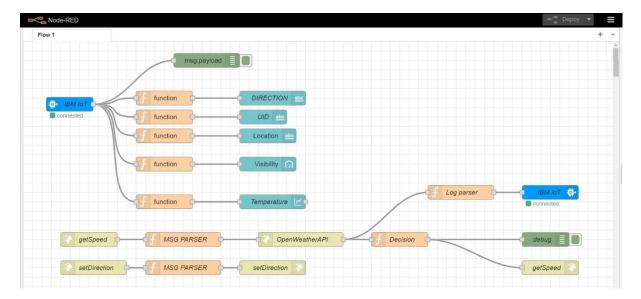

Code Flow:

Node RED:

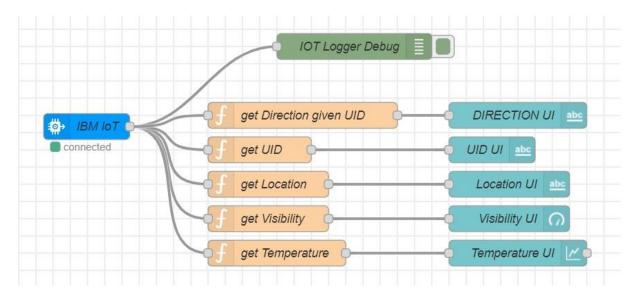

Node RED flow:

There are 3 flows in the above Node RED flow. They are

- 1.Node RED UI flow
- 2./getSpeed API flow 3. /setDirection API flow 1.

Node RED UI flow:

- 1. "IBM IOT" node connects the backend to Node RED UI
- The function nodes such as "get Direction given UID", "get UID", "get Location", "get Visibility" & "get Temperature" extract the respective data out and provides them to the UI nodes "Direction UI", "UID UI", "Location UI", "Visibility UI" & "Temperature UI".

```
// get Direction given UID
msg.payload = global.get(String(msg.payload.uid)); return
msg;
// get UID
```

```
msg.payload = msg.payload.uid; return
msg;

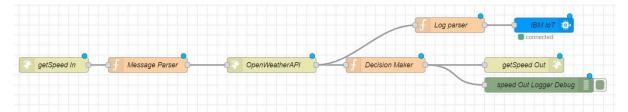

// get Location
msg.payload = msg.payload.location; return
msg;

// get Visibility
msg.payload = msg.payload.visibility; return
msg;

// get Temperature
msg.payload = msg.payload.temperature; return
msg;
```

3. "IOT Logger Debug" node logs the data at debugger.

2. /getSpeed API flow:

- 1. "getSpeed In" node is an http end point. It accepts parameters like microcontroller UID, location, school & hospital zones info.
- 2. "Message Parser" node parses the data and passes on only required information to the next node

```
global.set("data",msg.payload);
msg.payload.q = msg.payload.location;
msg.payload.appid = "bf4a8d480ee05c00952bf65b78ae826b"; return
msg;
```

- 3. "OpenWeatherAPI" node is a http request node which calls the OpenWeather API and send the data to the next node.
- 4. "Log Parser" node extracts specific parameters from the weather data and and sends it to the next node.

```
weatherObj = JSON.parse(JSON.stringify(msg.payload)); localityObj
= global.get("data");

var suggestedSpeedPercentage = 100;

var preciseObject = {
```

- "IBM IoT" node here (IBM IoT OUT)connects the "IBM IoT" node (IBM IoT IN) metioned in the Node RED UI flow which enables UI updation and logging.
- 6. "**Decision Maker**" node processes the weather data and other information from the micro controller to form the string that is to be displayed at the Sign Board

```
weatherObj = JSON.parse(JSON.stringify(msg.payload)); localityObj
= global.get("data");
var suggestedSpeedPercentage = 100;
var preciseObject = {
    temperature : weatherObj.main.temp - 273.15,
    weather : weatherObj.weather.map(x=>x.id).filter(code => code<700),</pre>
visibility : weatherObj.visibility/100
if(preciseObject.visibility<=40)</pre>
suggestedSpeedPercentage -=30
switch(String(preciseObject.weather)[-1]) //
https://openweathermap.org/weatherconditions refer weather codes meaning here
    case "0" : suggestedSpeedPercentage -=10;break;
case "1" : suggestedSpeedPercentage -=20;break; case
"2" : suggestedSpeedPercentage -=30;break;
msg.payload = preciseObject;
var doNotHonk = 0;
if(localityObj.hospitalZone=="1"||localityObj.schoolZone=="1")
doNotHonk = 1;
var returnObject = {
    suggestedSpeed : localityObj.usualSpeedLimit*(suggestedSpeedPercentage/100),
doNotHonk : doNotHonk
}
msg.payload = String(returnObject.suggestedSpeed) + " kmph \n\n" +
(returnObject.doNotHonk==1?"Do Not Honk":"") + "$" +
global.get(String(localityObj.uid));
return
msg;
```

- 7. "getSpeed Out" node returns a http response for the request at node "getSpeed In".
- 8. "speed Out Logger Debug" logs the data for debugging.

3. /setDirection API flow:

- 1. "setDirection In" node is an http end point. It accepts parameters like microcontroller UID & direction.
- 2. "set Direction Function" node sets the direction for the given UID.

global.set(String(msg.payload.uid),msg.payload.dir); return
msg;

3. "setDirection Out" node returns a http response for the request at node "setDirection In".
